

Payroll Workflow Guide

NetToGros Ireland - Local & Cloud Practice Modes

Document date: 15 June 2026

This guide explains how Run Payroll, Calculate Preview, Commit, and Submit work in the current NetToGros payroll application. It covers tax credits (TC), cut-off points (COP), period handling, local vs cloud behaviour, and what is (and is not) supported when multiple payroll runs are prepared in advance.

1. Project context

1.1 Two operating modes (per company)

Mode	Storage	TC / COP source	Revenue
Local	localStorage + JSON backup	Manual from employee card	None
Cloud	localStorage (DB later)	RPN from fake server	Fake server port 3001

Practice companies: Company 1 = Local (Sandbox Ltd), Company 2 = Cloud (Cloud Sandbox), Company 3 = user chooses mode on first entry.

1.2 Running locally

- Serve from project root: `python -m http.server 8000`, open `http://localhost:8000/payroll/`
- If serving only the payroll folder, use `js/calculator-core.js` fallback.
- Cloud mode also needs the fake Revenue server on port 3001.

2. Run Payroll workflow overview

The payroll cycle has four stages. Each has different effects on periods and tax balances.

Stage	Action	Period changes?	TC/COP consumed?
Preview	Calculate Preview	No	No
Commit	Commit to Payroll	Counters advance	Yes
Submit local	Submit Period	Period closes	Locked in
Submit cloud	Submit to Revenue	Period closes + RPN refresh	RPN updated

Recommended flow: Preview (repeat) -> Commit once -> Submit -> next period.

3. Calculate Preview

3.1 What it does

Reads timesheet inputs, calculates PAYE/USC/PRSI per employee by frequency, shows preview tables and enables Commit. Does not save to history or consume TC/COP.

3.2 Safe to repeat

Same inputs give the same results. Change hours or employee TC/COP on the card and the next preview updates - still without consuming credits until commit.

3.3 Technical fix (June 2026)

- Fallback loader for calculator-core.js.
- Event delegation for Calculate Preview and Commit buttons.
- Safe state-machine fallback and clear error messages.
- initOrSyncLedger() before preview for current card/RPN values.

4. Tax credits and COP by mode

4.1 Local mode

PAYE uses ledger remaining TC and copRemaining COP per periods per year. Before any commit, remaining equals annual values from the employee card.

4.2 Cloud mode

With RPN: uses periodicTaxCredit and periodicStandardRateCutOffPoint. Without RPN: emergency rules.

4.3 Ledger sync on preview

initOrSyncLedger refreshes annual TC/COP from card/RPN but keeps taxCreditsUsed and copUsed from prior commits.

5. Commit to Payroll

- Run saved to history as 'committed'.
- Ledger: taxCreditsUsed and copUsed increase.
- State machine: commitCounter up; run in committedRunIds.
- Week/frequency counters advance.
- UI hides timesheet; shows committed view with Rollback / Submit actions.

6. Submit and period closure

6.1 Local - Submit Period

Marks all committedRunIds as submitted, creates submission record, advancePeriod() opens next period.

6.2 Cloud - Revenue submission

Generate Submission from latest committed run. Submit to Revenue (POST /psr), then submitPeriod and refreshCloudTaxValuesAfterSubmit updates employee RPN remaining TC/COP.

7. Multiple previews vs multiple commits

7.1 Multiple previews - SUPPORTED

Preview is a dry run. Period and TC/COP balances unchanged.

7.2 Multiple commits before submit - NOT SUPPORTED

After first commit, Calculate Preview is hidden until Submit or Rollback. Cannot stack week 26, 27, 28 commits and submit on different due dates.

Enforced sequence: Preview -> Commit -> Submit -> Preview next week -> ...

7.3 Data model note

committedRunIds can hold multiple runs and performSubmit marks all submitted together, but UI blocks second commit. Cloud PSR uses latest committed run only.

8. Vacation / assistant scenario

8.1 Requested use case

Commit payrolls in advance; assistant submits each on due date in correct order.

8.2 Current answer: NOT SUPPORTED

- No submission queue with due dates.
- No per-run submit or ordering choice.
- Cannot commit future weeks while earlier commits await submit.

8.3 Practical guidance today

- Commit only payroll due now; submit before leaving.
- Repeat weekly; do not batch future weeks.

8.4 Future enhancement (deferred)

Queue model: Commit saves run and advances week; Submit per pay date with clear labels in History.

9. Quick reference

Action	Period on screen	weekNumber	TC/COP remaining
Preview (repeat)	No change	No change	No change
Card edit + Preview	No change	No change	Annual refresh only
Commit	Committed view	Advances	Consumed
Rollback	Restored	Restored	Reversed
Submit	Next period	Period reset	Cloud RPN refreshed

Location	Information
Committed panel	Commit count, net total, pay date, periods
History	Date, period label, Committed/Submitted, gross/net
Tax Credits tab	Annual TC/COP, used, remaining, source
Submission tab	PSR records and JSON (cloud)

10. Glossary

- TC - Tax Credits.
- COP - Cut-Off Point (standard rate band).
- RPN - Revenue Payroll Notification (cloud, simulated).
- PSR - Payroll Submission Request.
- Open period - Awaiting submit; new preview blocked after commit.
- Ledger - Per-employee annual TC/COP and used/remaining tracking.
